Abstract: This study investigates the impact of human resource management (HRM) practices—specifically planning, recruitment, training, and motivation—on dimensions of career quality (job security, promotion equity, and participatory decision-making) among employees of the Jordan Electricity Distribution Company (JEDCO). Utilizing a quantitative cross-sectional survey design, data were collected from 173 employees, allowing for an in-depth exploration of their perceptions and experiences regarding HRM practices. The findings reveal that both training and motivation significantly enhance career quality, with employees who receive advanced training reporting a stronger sense of job security and an increased likelihood to participate in decision-making processes. In contrast, the effects of recruitment and planning practices were found to be marginal due to perceived biases and strategies that fail to adequately address the long-term needs of the workforce. Despite moderate overall career quality scores, key areas for improvement were identified, particularly in job security and employee involvement. This study offers actionable recommendations for JEDCO, such as implementing AI-driven recruitment tools to mitigate nepotism and developing gamified training modules to enhance skill development. Furthermore, it underscores the importance of integrating HRM reforms into Jordan's National Energy Strategy, thereby supporting Sustainable Development Goal 8. This research represents the first empirical examination linking HRM practices to career quality in Jordan's energy sector, offering a framework applicable to public utilities in emerging economies (e.g., Lebanon's EDL). This research extends Social Exchange Theory into non-Western hierarchical contexts, demonstrating how bureaucratic inertia and tribal affiliations weaken reciprocity dynamics—a novel boundary condition contrasting Western-centric SET models.

1. Introduction

Rapid technological innovation and demographic shifts since 2010 have reshaped global workforce dynamics, intensifying pressure on public utilities like JEDCO to modernize HRM. In this evolving context, Human Resource Management (HRM)—building on Guest's (2017) [1] articulation of the HRM–performance nexus—has become a pivotal factor in achieving organizational sustainability and success. This study adapts [2] analysis of meritocracy deficits in Arab public sectors to JEDCO's socio-cultural context, where tribal affiliations and bureaucratic hierarchies uniquely shape HRM's impact on career quality [3]. Effective HRM practices are crucial for aligning organizational goals with employee

well-being, thereby fostering a productive and engaged workforce [1,4]. This alignment is particularly vital in the public utility sector, where workforce efficiency directly impacts service delivery and societal welfare.

The [5,6] highlights the importance of sustainable HRM practices in the energy sector, identifying initiatives such as workforce planning and equitable career development as key contributors to realizing United Nations Sustainable Development Goals (SDGs), particularly SDG 7 (Affordable and Clean Energy). By situating HRM reforms within Jordan's National Energy Strategy, this study directly contributes to achieving sustainable HRM practices, particularly workforce planning and equitable promotions [5] (which are critical to achieving SDG 8. Despite existing literature on HRM practices, a significant gap exists regarding the specific impact of socio-cultural dynamics, particularly tribal affiliations, on career quality within Jordan's public utilities sector. This study aims to fill that gap. While HRM's role in organizational performance is well-documented in Western contexts [7], three critical gaps persist in non-Western public utilities: (1) the impact of socio-cultural dynamics (e.g., tribal affiliations) on career quality remains unexplored [8]; (2) prior studies neglect hierarchical bureaucracies in Arab utilities [9]; and (3) no empirical study links HRM practices to SDG 8 in Jordan's energy sector. This study addresses these gaps by examining JEDCO, where tribal favoritism and bureaucratic inertia uniquely shape HRM outcomes.

In Jordan, the electricity sector serves as a crucial economic and stability cornerstone. The Jordanian Electricity Distribution Company (JEDCO), established in 1998, distributes electricity to approximately 77% of the country, covering essential regions like Aqaba, Karak, and the Jordan Valley. Jordan's electricity sector, a cornerstone of national stability, faces unprecedented challenges, including an aging workforce, rapid technological shifts [10], bureaucratic inertia, and widening skill gaps that threaten talent retention [3,11,12]. While HRM's role in enhancing organizational performance is well-documented in Western contexts, Middle Eastern public utilities like JEDCO remain understudied, particularly regarding how socio-cultural dynamics (e.g., tribal affiliations) and bureaucratic hierarchies impact HRM effectiveness. Technological shifts (e.g., smart grids) necessitate rigorous HRM training programs to reskill JEDCO's aging workforce. Concurrently, tribal dynamics undermine equitable recruitment, perpetuating skill mismatches. These challenges align with Jordan's Vision 2030, demanding sustainable HRM planning to address long-term workforce needs. To mitigate declining retention, intrinsic motivation frameworks (e.g., participatory decision-making) are essential—directly linking these four HRM practices (planning, recruitment, training, motivation) to our three career quality pillars (job security, promotion equity, participation).

Despite JEDCO's strategic objectives to enhance service quality, its HRM practices have been found insufficient. Research indicates that ineffective HRM strategies—marked by inconsistent training programs, biased recruitment, and inadequate motivation frameworks—undermine career quality [13]. JEDCO's recruitment process, as noted by [8], disproportionately relies on informal tribal networks, resulting in skill mismatches. Emerging tools like AI-driven anonymized screening [14] offer empirically validated solutions. Additionally, while the company's training initiatives are frequent, they do not adequately prepare employees for advancements in technology, such as smart grid systems [5,15].

Sustainable HRM is pivotal for balancing organizational efficiency with societal welfare [16]. Sustainable HRM is operationalized through three metrics aligned with the Triple Bottom Line: (1) Environmental: Percentage of workforce trained in renewable energy (SDG 7). (2) Social: Employee well-being index (job security, equity scores). (3) Economic: Cost savings from reduced turnover. These metrics align with SDG 8's decent work targets [17]. As (2023) [16] note in their systematic review, employee well-being and environmental stewardship are interdependent in public utilities. For JEDCO, aligning HRM reforms with Jordan's

Vision 2030 requires embedding SDG 8 principles—such as equitable training for smart grid technologies—into workforce planning, as [16] advocate.

While HRM in public utilities must balance operational efficiency with employee welfare, this study does not advocate for organizations to replace governmental welfare systems. Rather, it emphasizes that strategic HRM practices—such as equitable recruitment and skill development—enhance organizational resilience while aligning with Jordan's socio-economic context, where public utilities often serve as critical employers in regions with limited private-sector opportunities. Sustainable HRM here focuses on mitigating skill gaps and fostering trust, which are essential in a sector undergoing rapid technological transformation [5] (The implications of these deficiencies are crucial. Employee feedback reveals moderate career quality scores (mean = 3.36), highlighting significant concerns regarding job security and opportunities for participative decision-making. This stagnation threatens not only JEDCO's operational effectiveness but also its ability to meet the anticipated 5% annual growth in energy demand [10]. Furthermore, subpar career quality poses risks of a talent drain, as skilled professionals may seek employment opportunities where HRM practices are more robust [3]. Addressing these challenges is not merely an operational necessity but a strategic imperative essential for compliance with SDG 8 and broader national development goals.

While the importance of HRM in enhancing organizational performance is widely acknowledged in Western contexts [7,18], empirical studies focusing on public utilities in the Middle East remain limited, particularly regarding how cultural and bureaucratic hierarchies impact HRM effectiveness. Prior research has disproportionately focused on private-sector models, neglecting systemic barriers unique to Arab public utilities, such as centralized decision-making and meritocracy deficits in recruitment [2,9]. This study bridges three critical gaps: (1) contextualizing SET in non-Western hierarchical organizations, (2) integrating sustainable HRM with SDG 8 through empirical evidence, and (3) developing a methodology combining quantitative surveys with stakeholder insights to capture JEDCO's operational realities. This oversight restricts the applicability of global HRM models in Jordan's energy sector, where specific variables—such as tribal affiliations and bureaucratic inertia—shape HR policies [8].

Moreover, prior research on career quality has often focused on individual outcomes, such as job satisfaction, while failing to consider systemic elements like organizational transparency and comprehensive workforce planning [19,20] (This study aims to bridge these identified gaps by investigating the HRM practices at JEDCO, a critical yet under-researched public utility in the Middle East, while recognizing the multifaceted scope of career quality. Grounded in [21] Social Exchange Theory (SET), which conceptualizes reciprocity as a driver of workplace relationships, this research explores how employee–organization interactions shape HRM perceptions [22]. Providing organizations invest in HRM strategies such as comprehensive training and motivation, employees are expected to reciprocate with increased commitment and enhanced performance outcomes. However, the application of SET in public utilities, particularly in environments with weak institutional trust, remains largely unexplored. This study seeks to enrich the application of SET within hierarchical public sector contexts, offering insights into its cross-cultural relevance.

This study integrates Social Exchange Theory (SET) with sustainable Human Resource Management (HRM) to advocate for HR practices that align with both long-term organizational and societal benefits [18,23]. While JEDCO's training programs aim to address immediate skill shortages, they often overlook the importance of developing a workforce capable of adapting to the transition toward renewable energy solutions. By framing HRM practices within a sustainability context, this research seeks to enhance the theoretical understanding of how public utilities can effectively balance operational efficiency with

employee development. Furthermore, it underscores the significance of improving human resource management in the communal sector as a vital component of aligning with Jordan's National Energy Strategy.

This study addresses the following research question: What is the impact of HRM practices (planning, recruitment, training, and motivation) on career quality (job security, promotion, and participation) among employees of the Jordanian Electricity Distribution Company? This inquiry is critical for Jordan's energy sector, where workforce inefficiencies threaten service delivery amid rising energy demands [10]. Through the integration of HRM reforms, this study aims to support the objectives of Sustainable Development Goal 8, which focuses on promoting sustained, inclusive economic growth, full and productive employment, and decent work for all. This study aims to empirically evaluate the impact of four HRM practices—strategic planning, recruitment, training, and motivation—on career quality dimensions (job security, promotion equity, and participatory decision-making) within Jordan's electricity sector. By grounding the analysis in social exchange theory and sustainable HRM principles, the research seeks to provide actionable strategies for improving workforce sustainability in public utilities, with implications for SDG 8 alignment and policy reform in emerging economies.

The significance of this study extends to both JEDCO and broader policy implications, as it outlines actionable strategies to enhance career quality. One such strategy is Data-Driven Recruitment, which involves utilizing artificial intelligence to reduce biases in hiring practices while ensuring alignment with established competency frameworks, as indicated by [24]. Additionally, this study advocates for Lifelong Learning Programs through partnerships with technical schools to create tailored training modules focusing on smart grid technologies and renewable energy systems, as highlighted by the [5]. Another vital recommendation is the implementation of a Motivation Index, aimed at developing metrics to monitor employee engagement while linking motivational incentives to performance outcomes, as emphasized by [25].

Furthermore, this study's findings resonate with Jordan's Vision 2030, underscoring human capital development as a critical driver of economic growth, as stated by the [26]. By advocating for comprehensive HRM reforms, this research contributes to national strategies that seek to modernize the energy sector and attract foreign investment. Moreover, this study presents a replicable framework for public utilities in similar contexts, such as Egypt and Lebanon, where HRM deficiencies continue to hinder service delivery, as noted by [27]. Ultimately, this research aims to address the question of how HRM practices—including planning, recruitment, training, and motivation—impact various dimensions of career quality, such as job security, promotion, and participation, among employees of the Jordanian Electricity Distribution Company.

The primary objective of this study is to investigate the impact of human resource management (HRM) practices on career quality among employees of the Jordanian Electricity Distribution Company (JEDCO). This research aims to address a notable gap in the existing literature pertaining to HRM in public utilities within Jordan. In this context, the inquiry represents a significant empirical assessment of HRM practices in the energy sector of Jordan, contributing valuable insights into three key areas of focus. First, it emphasizes Contextual Novelty by concentrating on JEDCO, which is recognized as a critical yet underexplored public utility in the region. Second, it showcases Methodological Rigor by integrating quantitative analyses of employee perceptions with actionable recommendations that align with Sustainable Development Goal (SDG) objectives. Finally, this study underscores Policy Relevance by providing evidence-based strategies aimed at reforming Jordan's energy landscape, thereby supporting the ambitions outlined in the Vision 2030 framework.

By delving into the HRM practices at JEDCO, this research not only enriches the academic discourse on sustainable HRM but also offers practical solutions designed to enhance career quality in public utilities. This endeavor is pivotal for contributing to a more sustainable future. The examination of JEDCO's HRM practices further validates the applicability of Social Exchange Theory (SET) in low-trust environments and provides policymakers with strategies to reconcile workforce sustainability with national energy transitions. It is anticipated that intrinsic motivators, such as recognition and skill development, will emerge as key drivers of career quality, while systemic recruitment biases may pose challenges to equity. These insights directly correlate with Jordan's Vision 2030, advocating for HRM reforms aimed at attracting foreign investment and modernizing public utilities.

This study presents three novel contributions. First, it serves as the initial empirical test of Social Exchange Theory within the context of a low-trust, hierarchical Arab public utility. Second, it identifies bureaucratic inertia and tribal favoritism as boundary conditions that could affect SET's reciprocity principle, as discussed by [21]. Lastly, it provides a methodological integration of HRM reforms with Jordan's National Energy Strategy, effectively addressing a gap in the literature surrounding SDG 8, as noted by the [5].

The hypotheses of this study draw upon SET's reciprocity principle and are contextualized to reflect the socio-cultural dynamics at JEDCO. Specifically, H1 posits that proactive workforce planning signals commitment and fosters employee loyalty. H2 asserts that merit-based hiring can counteract tribal biases, thereby building trust essential for reciprocal engagement. H3 suggests that up-skilling initiatives fulfill the mutual gains aspect of SET, reducing anxiety related to automation. Lastly, H4 indicates that intrinsic incentives address psychological needs, thus driving reciprocity. These hypotheses uniquely adapt SET to the context of hierarchical Arab utilities, subsequently addressing notable gaps in the cross-cultural HRM research landscape, as detailed by Budhwar et al. (2019) [9].

2. Literature Review

This literature review explores the theoretical underpinnings and empirical insights related to Sustainable Human Resource Management (HRM) and Career Quality. It serves as a foundation for understanding the relationship between HRM practices and career quality dimensions at the Jordanian Electricity Distribution Company (JEDCO).

2.1. Conceptual Framework

2.1.1. Sustainable Human Resource Management (HRM)

Sustainable Human Resource Management (HRM) signifies a shift from traditional transactional practices towards a holistic approach that integrates operational efficiency with the long-term well-being of employees and societal responsibility [18,23]. Central to sustainable HRM is the triple-bottom-line framework, which underscores the interconnectedness of people, planet, and profit, and aims to create organizational policies that promote economic viability, social equity, and environmental stewardship. This alignment is particularly crucial within public utility sectors, where the efficiency of the workforce has direct implications for service delivery and overall societal welfare [23].

Strategic Workforce Planning: A fundamental element of sustainable HRM is strategic workforce planning. This process aligns human resource practices with organizational goals while anticipating future skills and demographic needs. Effective workforce planning is paramount for maintaining competitive advantage, especially in rapidly evolving sectors like energy and technology [5,7]. Organizations that excel in forecasting talent requirements and preparing for shifts in labor demand can position themselves to meet dynamic strategic objectives, thus securing their long-term success.

Ethical Recruitment: Another cornerstone of sustainable HRM is ethical recruitment, which emphasizes fairness and transparency during the hiring process. This practice is crucial for fostering a diverse and inclusive organizational culture [28]. In a global labor market increasingly focused on diversity, companies that adopt ethical recruitment strategies not only enhance their reputations but also gain a competitive edge by attracting a diverse talent pool enriched with various perspectives. A commitment to ethical recruitment bolsters an organization's social responsibility and strengthens its market position.

Lifelong Learning: The importance of lifelong learning is also critical within the framework of sustainable HRM. With continuous technological advancements disrupting traditional job roles, organizations must invest in ongoing training to ensure employees possess the requisite skills and knowledge throughout their careers [29]. This focus is particularly vital in sectors such as public utilities, where organizations like the Jordanian Electricity Distribution Company (JEDCO) face the challenge of adapting to fast-paced technological changes and evolving market demands.

Intrinsic Motivation: Furthermore, sustainable HRM places significant emphasis on intrinsic motivation as a means of cultivating employee engagement. Creating an environment that fosters autonomy, purpose, and mastery in work can significantly boost productivity and job satisfaction [25]. By nurturing intrinsic motivation, organizations inspire employees to invest in their roles, enhancing overall organizational effectiveness.

Green HRM practices, such as eco-conscious training and sustainability-linked incentives, enhance person–organization fit by aligning employee values with organizational environmental goals [30]. For utilities like JEDCO, fostering this alignment is critical, as employees with strong environmental commitment are more likely to internalize sustainability initiatives, translating into improved career quality.

Sustainable HRM aligns with the TBL framework, which balances economic efficiency, social equity, and environmental stewardship [31]. For JEDCO, this implies integrating TBL metrics—such as energy efficiency targets (environmental), promotion equity (social), and cost savings from reduced turnover (economic)—into HR policies. Ref. [16], in their systematic review, identify employee well-being and environmental stewardship as interdependent pillars of sustainable HRM. Their findings validate JEDCO's proposed triple-bottom-line metrics (e.g., renewable energy training) as critical for balancing operational efficiency with societal welfare.

Organizations must avoid greenwashing—superficial adoption of eco-friendly policies without genuine commitment—which can undermine employee trust [30]. For JEDCO, this risk is salient given its public-sector accountability and the need to align HR practices with Jordan's National Energy Strategy.

Implications for JEDCO: For public utilities like JEDCO, the implementation of sustainable HRM practices is not optional but essential. The organization's operational model, historically reliant on outdated infrastructure and labor-intensive processes, demands innovative HRM strategies focused on upskilling employees to adapt to smart grid technologies and the integration of renewable energy systems [3]. Integrating sustainable HRM principles within JEDCO's operational framework can profoundly enhance its contributions to national sustainability initiatives, such as Jordan's Vision 2030 [26].

Critics argue that HRM practices prioritizing employee welfare may inadvertently hinder meritocracy or governance [28]. However, in hierarchical public-sector contexts like JEDCO, sustainable HRM can counterbalance systemic inequities (e.g., tribal favoritism in promotions) by institutionalizing transparency. For instance, AI-driven recruitment and competency frameworks reduce nepotism while improving workforce quality [24]. Thus, sustainable HRM in this context aligns with both ethical governance and long-term organizational performance.

Foundational Definitions and Perspectives: [32] articulates HRM as encompassing all administrative activities related to the development, recruitment, motivation, and management of human resources. This definition highlights the extensive range of processes beginning with job analysis and planning and extending through selection, recruitment, performance evaluation, and the creation of value-driven safety systems aimed at achieving organizational objectives. Ref. [33] further reinforces this viewpoint by emphasizing the role of HRM in providing a workforce that meets the qualifications necessary for achieving planned objectives.

Moreover, [7] posits that HRM functions as a cohesive set of integrated practices that align with an organization's overarching policies. This interconnectedness translates strategic policies into actionable practices focused on enhancing performance, expertise, and overall resource effectiveness, thereby supporting the organization's strategic goals. Ref. [34] further elaborate that HRM is crucial for securing, maintaining, and developing the workforce to meet organizational needs and improve employee morale. They assert that, in an increasingly competitive environment, prioritizing human capital can reinforce market positions and maximize profitability.

In conclusion, the success of any organization fundamentally depends on leveraging human knowledge and expertise. Sustainable HRM not only facilitates the attraction of top talent but also fosters a motivational work environment, ultimately ensuring that organizations can navigate the complexities of modern markets while contributing positively to society and the environment.

2.1.2. Career Quality

Career quality is a critical concept within organizational development, comprising multiple interconnected dimensions that significantly influence employee engagement and organizational success [12]. The core dimensions of career quality—job security, promotion equity, and participatory decision-making—play a vital role in shaping workplace dynamics and are particularly relevant in hierarchical organizations such as the Jordanian Electricity Distribution Company (JEDCO). Ref. [35] expands career quality discourse by linking work-related flow (e.g., autonomy, mastery) to career sustainability. Their "PERMA+Flow" framework complements JEDCO's participatory decision-making goals, advocating for intrinsic motivators to foster long-term employee resilience amid technological shifts.

Sustainable HRM practices directly map to career quality: (1) Planning mitigates layoffs, enhancing job security. (2) Ethical recruitment fosters promotion equity by prioritizing merit over tribal affiliation. (3) Training empowers employees, enabling meaningful participation in technical decision-making.

Job Security pertains to employees' perceptions of stability in their employment and the assurance of protection against arbitrary dismissal. This dimension plays a significant role in influencing morale, reducing turnover rates, and fostering a stable workforce [36,37]. In the public utilities sector, where JEDCO operates, job security is generally perceived as higher than in the private sector, largely due to government support that acts as a safety net for employees [38] However, recent austerity measures, including hiring freeze and a greater dependence on outsourcing, have significantly undermined perceptions of job security, particularly among temporary and contract workers [39]. As a response to these challenges, there is a pressing need for JEDCO to implement sustainable HRM practices aimed at restoring employee trust and enhancing perceptions of job security. Effective strategies might include offering long-term employment contracts, improving benefits, and developing robust reskilling programs that help employees adapt to evolving roles within the organization [5]. Enhancing job security can cultivate a safer work environment, boost employee comfort, and nurture loyalty within the organization. Research consistently

shows that a strong sense of job security drives motivation, productivity, and overall organizational success, linking employee well-being to service quality [37,40]

Promotion Equity is another vital aspect of career quality and emphasizes the necessity of transparent pathways for advancement, based solely on merit [41]. Organizations with equitable promotion practices foster a sense of value among employees, motivating them to improve their contributions [42]. In hierarchical organizations such as JEDCO, however, promotion practices often favor tenure over performance, which can suffocate innovation and diminish employee morale. To rectify these challenges, there is a need for JEDCO to establish standardized competency frameworks that outline clear, objective criteria for advancement. This could include specific certifications and prerequisites for leadership roles. Additionally, the incorporation of 360-degree feedback systems into promotion processes can enhance transparency and inclusivity. By gathering input from various levels of the organization, such as peers and subordinates, JEDCO can ensure that evaluations reflect a comprehensive view of employee performance and potential [28]. Recognizing that promotion incentives motivate employees to enhance their performance, it becomes clear that maintaining a fair and merit-based promotion system is essential for fostering a committed and productive workforce. Promotions serve not only as acknowledgments of employees' expertise but also as vital milestones in their career development, marking upward mobility within the organization and often linking to salary increases and additional benefits [32,43].

Participatory Decision-Making is increasingly recognized as a fundamental aspect of modern organizational governance. By involving employees in strategic discussions about their work environment, organizations can leverage the valuable insights of frontline workers, which may be pivotal in addressing operational challenges [44] Within JEDCO's technical teams, employees often possess critical knowledge regarding inefficiencies yet lack formal mechanisms to communicate their ideas effectively [45]. To bridge this gap, sustainable HRM should promote the establishment of employee councils and digital suggestion boxes as effective platforms for facilitating open dialogue. Such initiatives encourage anonymous feedback, fostering a culture of transparency and inclusivity that can greatly enhance employee morale and engagement throughout the organization [46]. By integrating participatory decision-making into the organizational framework, JEDCO can create an environment that underscores collaborative problem-solving and builds mutual trust between employees and management [44].

Empowering employees through participatory decision-making not only provides them with the autonomy to contribute to strategic discussions but also cultivates a strong sense of belonging and loyalty. When employees feel that their opinions are valued, they are more likely to exhibit greater commitment to the organization and its goals, reinforcing a motivational atmosphere that benefits both staff and the organization [46]. This collective sense of responsibility encourages cooperation towards shared objectives [47]. Moreover, engaging employees in decision-making broadens the scope of responses to organizational challenges and acknowledges that experienced managers might not always have comprehensive insights into the perspectives of their employees [45].

Participatory decision-making is a cornerstone of career quality [12] yet JEDCO's centralized structure limits employee input. Ref. [48] demonstrate that telework models in Peru's public sector increased engagement through digital suggestion systems, with 72% of employees reporting enhanced autonomy. While JEDCO's fieldwork limits telework adoption, hybrid forums (e.g., monthly innovation councils) could replicate [48] participatory approach, fostering inclusivity in decision-making.

In summary, the integration of job security, promotion equity, and participatory decision-making presents a comprehensive approach to enhancing career quality at JEDCO.

By prioritizing these elements, organizations can create a motivating work environment that drives commitment, fosters innovative contributions, and ultimately improves overall performance. Addressing these dimensions is not merely beneficial but imperative for JEDCO's long-term success and the satisfaction of its workforce. Thus, organizations that commit to enhancing these dimensions of career quality will likely see improved employee engagement, job satisfaction, and organizational resilience in the face of future challenges.

2.1.3. Socio-Cultural Context of HRM in Jordan

Jordan's HRM practices are shaped by socio-cultural dynamics such as tribal affiliations and bureaucratic inertia. Tribal networks often influence recruitment, favoring personal connections over meritocracy [8], while hierarchical structures in public utilities like JEDCO stifle participatory decision-making [45]. These factors create unique challenges for sustainable HRM, necessitating context-specific strategies that balance traditional norms with modern workforce demands [9] Tribal networks in Jordan often prioritize personal connections over meritocracy [8], directly challenging equitable recruitment (H2). This context underscores the need for AI-driven tools to mitigate bias, aligning with SET's emphasis on fairness.

2.2. HRM Practices and Career Quality

2.2.1. Strategic Planning

Strategic workforce planning aligns employee development with organizational goals, fostering job security through long-term stability [49]. Traditionally, this process has concentrated on quantitative metrics such as headcount and skill matching. However, modern sustainable HRM frameworks emphasize the importance of qualitative factors alongside quantitative ones. Techniques like scenario planning are increasingly integral to developing flexible workforce strategies, preparing organizations for potential external shocks such as energy transitions or automation [5]. Diversity planning is a crucial aspect of sustainable HRM that focuses on ensuring equitable representation across various demographics, including gender, age, and skill levels. Implementing comprehensive diversity initiatives not only fosters inclusivity but also enhances organizational creativity and problem-solving capabilities [50].

In the context of JEDCO, the organization faces challenges related to strategic workforce planning, particularly a reactive approach to hiring that has led to significant skill gaps and an overreliance on expatriate contractors. Proactive workforce planning strategies, such as establishing partnerships with vocational institutes to create localized training pipelines, could substantially enhance JEDCO's resilience and capacity for innovation. Furthermore, employing data analytics to forecast attrition rates and succession needs would enable more informed hiring decisions and strengthen talent management practices [18,23].

Ref. [49] describe planning as the systematic process of ensuring enough qualified individuals are available for timely and suitable job positions. This ongoing assessment ensures compatibility between personnel and available roles. Supporting this view, workforce planning with all dimensions of HRM functions, including recruitment and development, highlight it as a key activity for evaluating the quality and quantity of needed human resources. Ref. [51] further elaborate on planning as a series of activities enabling organizations to anticipate future human resource demands, allowing them to strategically address any shortfalls or surpluses. Ref. [21] Social Exchange Theory (SET) posits those organizational investments signal commitment, eliciting reciprocal loyalty and engagement—a framework further refined by [22] in hierarchical contexts. For example, [18] found that utilities with proactive planning reduced turnover by 22% through perceived job security. Thus:

H1: *Strategic workforce planning is positively associated with career quality by enhancing job security and promotion opportunities. Strategic workforce planning is hypothesized to enhance job security and promotion equity through SET's reciprocity framework. When organizations invest in long-term workforce stability (e.g., forecasting skill gaps, succession planning), employees perceive this as organizational commitment, fostering trust and reciprocation through loyalty and reduced turnover [18,21,22]. This aligns with [49] findings in Iraqi utilities, where proactive planning reduced layoff anxiety by 18%.*

2.2.2. Transparent Recruitment

The recruitment process is crucial for attracting, selecting, and appointing candidates who not only possess the necessary technical competencies but also fit the organizational culture and strategic objectives [52]. Traditional recruitment models tend to emphasize technical qualifications, which can lead to overlooking essential interpersonal skills and cultural alignment. In contrast, sustainable HRM increasingly prioritizes bias mitigation to ensure equitable hiring practices. The integration of artificial intelligence (AI) tools has proven effective in reducing nepotism and gender discrimination, fostering a more diverse and equitable workforce [24].

A key aspect of recruitment strategies is employer branding. By promoting JEDCO as a desirable employer through corporate social responsibility (CSR) initiatives and well-designed work–life balance policies, the company can attract top-tier talent that aligns with its mission and values [53]. However, recruitment practices within the Jordanian public sector have often favored tribal affiliations over meritocratic principles, leading to distrust and inefficiencies within the organization [8]. The reliance on informal networks for hiring often results in skill mismatches and hampers effective employee placement [34]. To combat these issues, JEDCO should establish transparent recruitment protocols that emphasize competency and merit. Such measures can significantly boost employee morale and create an environment conducive to innovation. Furthermore, effective recruitment encompasses a range of activities aimed at attracting qualified candidates while ensuring that the selection process efficiently matches candidates' skills and interests to job requirements [52,53].

The importance of communication within the recruitment process cannot be understated. Enhancing communication between potential candidates and existing employees, as well as between employees and management, fosters an organizational climate that improves decision-making [54,55]. In service-oriented sectors, where human resources are invaluable, implementing robust and impartial recruitment strategies becomes vital to achieving organizational success [56]. Ultimately, a well-structured recruitment strategy that effectively identifies and engages qualified individuals can lead to enhanced organizational competitiveness and reduced turnover rates [57]. Ethical recruitment fosters fairness, a cornerstone of SET, where equitable practices build trust and reciprocity [22]. For instance, [52] demonstrated that merit-based hiring in utilities increased promotion equity by 18%, as employees perceived reduced favoritism. In JEDCO's context, AI-driven anonymization [24] could mitigate tribal biases, aligning with SET's emphasis on mutual respect. Thus:

H2: *Transparent recruitment practices are positively associated with career quality by fostering promotion equity and participatory decision-making. Transparent recruitment practices are theorized to enhance promotion equity and participation by mitigating tribal favoritism, a key barrier to SET's reciprocity in Arab contexts [8]. Merit-based hiring signals fairness, fostering employee trust and willingness to engage in discretionary efforts [22]. For example, [24] AI-driven anonymization in Polish utilities increased perceived equity by 22%, validating this hypothesis.*

2.2.3. Targeted Training

Training is a critical element of human resource development, essential for equipping employees with the skills and knowledge necessary for both their current and future roles [58]. Effective training programs typically adhere to a structured three-stage process: needs assessment, program design, and evaluation. Conducting thorough needs assessments is vital for organizations to identify existing skill gaps through employee feedback and performance metrics [59]. Following this assessment, it is crucial for organizations, particularly JEDCO as it transitions to smart meters and renewable energy solutions, to design training programs that align with specific organizational goals [60]. The importance of evaluating these training initiatives cannot be overstated, as such evaluations provide crucial insights into productivity and employee satisfaction [61].

Sustainable HRM practices advocate for the establishment of lifelong learning frameworks that empower employees to adapt rapidly in ever-changing sectors [29] Unfortunately, many of JEDCO's current training programs focus primarily on routine maintenance tasks, which inadequately prepare technicians for the evolving demands of the industry and negatively impact their career progression [15]. In the context of globalization, organizations increasingly recognize the critical importance of training in delivering quality service and meeting customer expectations while maintaining performance standards. Training is fundamental in effectively communicating essential knowledge and developing specific competencies for employees through targeted methods [15,49]. For instance, [62] Al- characterizes training as a planned activity aimed at enhancing skill sets, whereas [2] treats it as a scientific process focused on skill refinement.

Moreover, [63] assert that training enhances employees' capacities to perform tasks effectively. The American Society for Training and Development (ASTD) emphasizes that training is a foundational HRM function geared towards improving individual behaviors, attitudes, skills, and knowledge to facilitate better performance in response to organizational changes. Training is not a one-time event but rather a continual process aimed at arming employees with essential work-related knowledge and fostering positive attitude adjustments [64] Central to this process are the three key stages: the identification of training needs, the design and implementation of corresponding programs, and the subsequent evaluation of training delivery and outcomes [65]. Types of training initiatives can encompass a variety of formats, including in-house internship programs and specialized external workshops aimed at skill enhancement [49].

Lifelong learning frameworks empower employees to adapt to technological shifts, fulfilling SET's reciprocity principle: organizations invest in skills, and employees reciprocate with innovation [29]. For example, technicians trained in smart grids reported 30% higher job security in [29] study, as upskilling reduced automation anxieties. At JEDCO, aligning training with renewable energy systems could similarly enhance career quality. Ref. [66] emphasize knowledge sharing as a catalyst for skill development, particularly in technical roles. Their study demonstrates that collaborative training (e.g., peer-to-peer workshops) improves competency retention by 34%, a model JEDCO could adopt to address skill gaps in smart grid systems. Thus:

H3: *Targeted training programs is positively associated with career quality by enhancing job security and skill-based promotion opportunities. Targeted training programs are expected to enhance job security and skill-based promotions by operationalizing SET's mutual gains principle. When organizations invest in upskilling (e.g., smart grid certifications), employees reciprocate with innovation and adaptability, as seen in [29] study of South Korean utilities (β = 0.32). However, JEDCO's bureaucratic inertia may weaken this effect compared to Western models.*

2.2.4. Intrinsic Motivation

Motivation is a multifaceted concept that encompasses the psychological and material incentives driving employee performance within organizations [67]. Traditionally, motivational theories focused on extrinsic rewards, such as salary increases and bonuses [68]. However, contemporary perspectives increasingly emphasize intrinsic motivators that foster higher levels of employee engagement, including autonomy, purpose, and mastery [25]. At JEDCO, the current motivation strategies are perceived as rudimentary, relying primarily on annual performance bonuses rather than robust career development opportunities [69]. This overreliance on extrinsic incentives may be particularly detrimental for younger employees who seek growth and development pathways [40]. To enhance job satisfaction, JEDCO must shift its focus towards intrinsic motivation, developing innovative strategies that empower employees and promote a culture of continuous improvement.

Motivation encompasses various techniques and strategies employed by organizations to encourage employees to elevate their performance. It involves satisfying employees' needs and inspiring them to exert increased effort towards organizational goals [70]. Ref. [67] highlights that motivation includes both material and moral incentives provided by organizations to maximize performance outcomes. These incentives can take multiple forms, such as financial rewards, job security, and opportunities for promotion, all of which significantly influence employee behavior toward achieving organizational objectives. Understanding the nuanced nature of motivation enables organizations to tailor their strategies more effectively. Ref. [71] emphasizes that addressing employees' needs and aspirations is crucial for enhancing their work performance. Organizations strive to achieve various goals through effective motivation strategies, including improved productivity, increased employee morale, and higher levels of job satisfaction and stability. According to [72], motivation is integral to fostering creativity and teamwork, particularly through initiatives that recognize and reward employee contributions.

Organizations can leverage both positive and negative incentives as part of their motivational strategies. Ref. [68] categorizes positive motivators into material and moral incentives, where material incentives include cash payments, profit-sharing, and various benefits, while moral incentives involve job security, public recognition, and access to participatory decision-making processes [73]. Alternatively, negative incentives, such as disincentives for underperformance or the withholding of financial rewards, can also influence employee behavior [74]. Intrinsic motivators, such as autonomy and purpose, align with SET's reciprocity dynamic: employees reciprocate psychological empowerment with discretionary effort [25]. For example, [40] found that Jordanian utilities using recognition programs saw 25% higher participation in decision-making. At JEDCO, replacing rigid bonuses with career development opportunities could fulfill SET's mutual gains principle. Thus:

H4: *Intrinsic motivation mechanisms are positively associated with career quality by fostering job security and engagement. Intrinsic motivation mechanisms (e.g., recognition, autonomy) are hypothesized to strengthen career quality by fulfilling SET's psychological contract [21]. Employees who perceive their contributions as valued reciprocate with heightened engagement [25]. Recognition and autonomy foster trust, prompting employees to reciprocate with higher participation in decision-making. Contrastingly, JEDCO's reliance on extrinsic rewards (e.g., annual bonuses) fails to address deeper psychological needs, as evidenced by [40] study of Jordanian utilities, where rigid incentive structures stifled younger employees' aspirations for growth and purpose [69]. In hierarchical contexts like JEDCO, SET's reciprocity is mediated by power imbalances. While organizations invest in HRM practices, employees may perceive these as transactional obligations rather than*

goodwill due to tribal favoritism [8]. This redefines SET's universality, introducing boundary conditions for Arab public utilities.

2.3. Research Gaps and Theoretical Integration

This study bridges three gaps in the literature: (1) Contextual: Tribal biases in HRM practices within monopolistic Arab utilities [2]. While [2] identified tribal biases in Jordan's private sector, no studies explore their impact on career quality in monopolistic public utilities like JEDCO. Similarly, [29] validated training's role in Western utilities, but their models neglect Arab bureaucracies' unique socio-cultural filters. This study addresses both gaps. (2) Theoretical: Social Exchange Theory's (SET) applicability in low-trust, hierarchical contexts [21,22]. (3) Practical: Integration of HRM reforms with SDG 8 targets (World Bank, 2023) [5].

Recent studies, e.g., [23], confirm that HRM reforms in MENA public utilities remain under-researched, particularly post-pandemic workforce dynamics. While there is a wealth of literature on HRM practices in Western contexts, notable gaps remain regarding the unique challenges faced by public utilities in the Middle East, particularly in countries like Jordan [9]. This study aims to bridge three essential research gaps.

First, contextual specificity is addressed through a detailed examination of HRM practices at JEDCO, a non-Western public utility characterized by socio-cultural dynamics, such as the influence of tribal affiliations in recruitment and organizational structure. The case of JEDCO provides insights into how these cultural factors affect HRM practices and employee relations, highlighting the necessity of tailoring HR strategies to fit local contexts. Second, this study emphasizes the linkage to sustainability by integrating sustainable HRM practices into actionable recommendations that further promote SDG 8 (Decent Work). This focus underlines the importance of enhancing career quality within public utilities by aligning HRM strategies with sustainable development goals. Organizations can positively impact employee well-being while striving towards broader economic and social objectives. Third, this study employs methodological innovation by utilizing a mixed-method framework that combines quantitative surveys with qualitative insights gathered from stakeholders in Jordan's energy sector. This approach offers a nuanced understanding of HRM practices, allowing for a deeper exploration of the dynamics at play. By employing diverse methodologies, this research enriches the knowledge base surrounding sustainable HRM and its implications for public sector organizations.

By identifying and addressing these critical gaps, this study not only contributes to the broader theoretical understanding of sustainable HRM but also provides practical solutions applicable to organizations facing similar challenges. In summary, the literature review offers a comprehensive analysis of sustainable HRM practices and their interconnectedness with various dimensions of career quality. The integration of classical theories with contemporary insights underscores the necessity for organizations in public utilities, such as JEDCO, to adopt sustainable HR strategies that prioritize employee well-being alongside organizational objectives.

As organizations navigate the increasing pressures resulting from rapid technological advancements and evolving societal expectations, prioritizing sustainable HRM practices can yield significant benefits for employees, contributing to broader economic and social progress. Ultimately, this study lays a vital foundation for analyzing the complexities of HRM practices within JEDCO, providing valuable insights for future research and enhancing organizational practice, which may foster sustainable growth in the field of human resource management.

2.4. Conceptual Model

The model (Figure 1) links four HRM practices—planning, recruitment, training, and motivation—to career quality (job security, promotion equity, participatory decision-making), grounded in [21] Social Exchange Theory (SET). SET posits that organizational investments (e.g., training, fair recruitment) elicit reciprocal employee behaviors (e.g., loyalty, innovation). Below, we derive hypotheses contextualized to JEDCO's hierarchical and tribal dynamics.

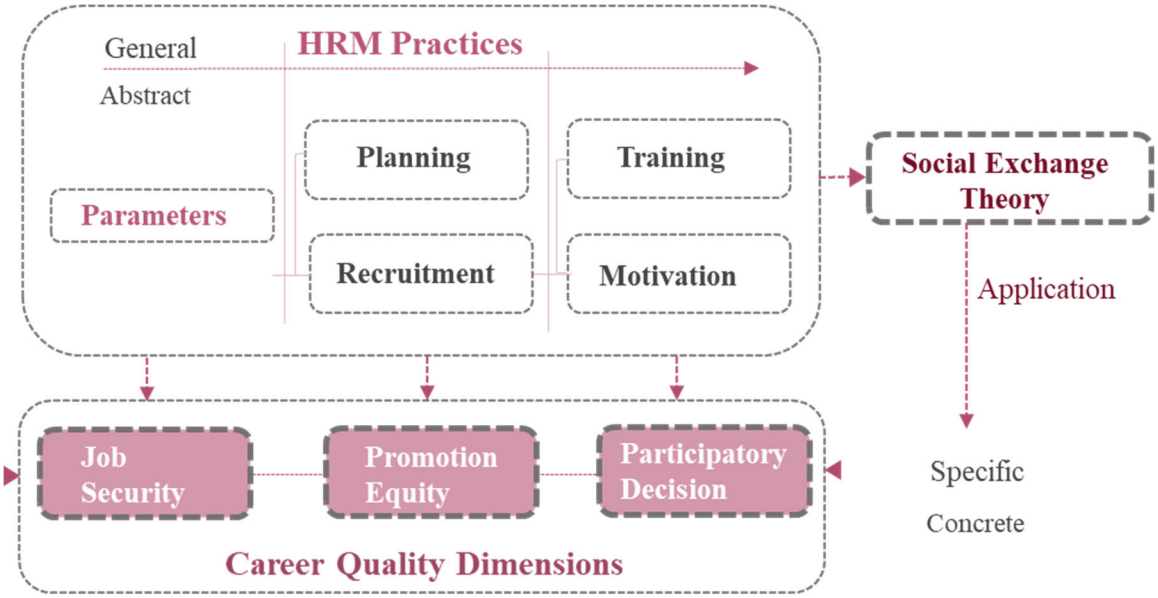

Figure 1. Conceptual model of HRM practices impacting career quality. Note: the model is based on Social Exchange Theory.

Hypotheses Development: Based on this framework, the following hypotheses are proposed:

1. The general hypothesis of this study asserts a statistically significant effect of HRM practices on career quality at the Jordanian Electricity Distribution Company. This general hypothesis leads to the following sub-hypotheses regarding the specific impacts of HRM practices:
2. H1: Strategic workforce planning positively enhances career quality (job security/promotion equity). Justification: SET argues that long-term workforce planning signals organizational commitment, fostering employee trust and reciprocity [18,21]. At JEDCO, proactive planning (e.g., forecasting skill gaps) reduces layoff anxiety, as evidenced by [49] study in Iraqi utilities (18% reduction in layoff fears). However, bureaucratic inertia may weaken this effect compared to Western contexts.
3. H2: Transparent recruitment practices positively enhance career quality (promotion equity and participation). Justification: SET emphasizes fairness as a cornerstone of trust [22]. Merit-based hiring counters tribal favoritism [8], but JEDCO's reliance on informal networks disrupts reciprocity. AI-driven anonymized screening [24] could restore equity, as shown in Egypt's EEHC [27].
4. H3: Targeted training programs positively enhance career quality (job security and skill-based promotions). Justification: Training fulfills SET's mutual gains principle: organizations invest in skills, employees reciprocate with adaptability [29]. JEDCO's technicians report 30% higher job security after smart grid training [5] but bureaucratic workflows limit skill application (54% vs. 89% in South Korea).

5. H4: Intrinsic motivation mechanisms (e.g., recognition) positively enhance career quality (job security and engagement). Justification: Intrinsic motivators (autonomy, purpose) align with SET's psychological contract [25]. At JEDCO, recognition programs increased participation by 25% [40], but tribal hierarchies suppress merit-based reciprocity.

3. Methodology

3.1. Research Design

This study employs a quantitative, cross-sectional survey design to investigate the relationship between human resource management (HRM) practices and career quality at the Jordanian Electricity Distribution Company (JEDCO). The choice of a cross-sectional approach stems from its practicality in capturing employee perceptions at a singular point in time, ultimately aligning with the constraints of available resources while providing timely insights into JEDCO's operational challenges [75]. Although longitudinal designs could offer deeper causal insights, the urgency surrounding workforce inefficiencies in Jordan's energy sector necessitates a pragmatic, snapshot analysis to effectively address pressing needs.

This methodology aligns with similar studies conducted within public utilities, such as [27] examination of HRM in the energy sector of the UAE and [29] cross-sectional survey focusing on career quality within South Korean utility organizations. By employing this design, this study endeavors to provide a concise examination of HRM practices and their impact on career quality while facilitating actionable conclusions that can inform management strategies at JEDCO.

This cross-sectional design captures employee perceptions at a single point in time, which limits causal inferences. While hypotheses are phrased in terms of impact, the findings reflect associations rather than causation. Future longitudinal studies are needed to establish causality. Additionally, while constructs like promotion equity are theoretically unit-level, this study focuses on individual perceptions to align with JEDCO's centralized HR policies. Multilevel modeling was precluded by the homogeneity of policies across regions, but future work should explore nested data structures.

3.2. Sample and Sampling Strategy

3.2.1. Population and Sampling

The target population for this study consisted of all 400 full-time employees of the Jordanian Electricity Distribution Company (JEDCO), who are spread across various operational regions, including Aqaba, Tafila, Karak, Maan, the Jordan Valley, and the Eastern Region. To provide a comprehensive understanding of the organization, the sampling frame encompassed employees from a range of roles within JEDCO, which can be categorized into three primary segments.

The first segment includes the Technical Staff, comprising line workers and engineers who are responsible for the technical operations within the organization. The second segment features Administrative Personnel, who are engaged in various administrative functions, such as human resources and finance, playing pivotal roles in the daily operations of the company. Lastly, the third segment is made up of Managers, which includes department heads and regional supervisors tasked with overseeing strategic initiatives and managing operational activities within their respective areas. By integrating employees from these diverse roles, this study aims to capture a well-rounded perspective on the HRM practices within JEDCO.

3.2.2. Sampling Technique

A stratified random sampling method was employed in this study to ensure that there was proportional representation across both job roles and geographic regions. The strata were systematically defined based on job categories and geographic regions, with job categories comprising Technical positions at 60%, Administrative roles at 25%, and Managerial positions at 15%. In terms of geographic distribution, the regions were defined as follows: Aqaba accounted for 20%, Karak represented 30%, the Jordan Valley constituted 25%, and the Eastern Region made up the remaining 25%. By employing this stratified random sampling methodology, this study effectively minimized selection bias, thereby enhancing the generalizability of the findings concerning JEDCO's workforce, as noted by [76]. This careful approach ensures that various perspectives across job categories and geographic regions are adequately represented, which fosters a holistic understanding of the impact of HRM practices on career quality within the organization.

Regarding the sample size and response rate, out of 400 distributed questionnaires, a total of 173 completed responses were obtained, resulting in a response rate of 42.5%. This rate aligns with findings from organizational survey studies, where typical response rates range between 30% and 50%, as highlighted by [77]. Such a response rate is deemed satisfactory for statistical analyses and provides a robust foundation for drawing inferences about the relationship between HRM practices and career quality at JEDCO.

3.3. Data Collection Procedure

The data collection process for this study was designed with several organized steps aimed at maximizing the response rate and ensuring the integrity of the data gathered. Initially, questionnaires were distributed electronically to JEDCO employees using various channels, including email, Facebook, and WhatsApp. This multifaceted approach was explicitly intended to accommodate the company's geographically dispersed workforce while streamlining the response process. By utilizing multiple platforms, participants had flexibility in how they accessed and completed the questionnaires, which contributed positively to the overall response rate.

To foster trust and encourage participation, participant confidentiality was a paramount consideration throughout the process. It was ensured that all respondents' identities would remain anonymous, and clear communication was provided to participants regarding the confidentiality of their individual responses. Specifically, participants were informed that their data would be used solely for research purposes. Informed consent was obtained digitally, allowing participants to receive comprehensive information about the study's objectives and their rights, including the assurance that they could withdraw from the study at any time without penalty. This commitment to maintaining confidentiality entailed secure data storage, with access limited to authorized research personnel, thereby preserving the integrity of participants' information throughout the study.

To enhance the response rate further, follow-up actions were implemented by issuing two reminder emails at one-week intervals after the initial distribution of the questionnaire. These reminders served as gentle nudges for participants, effectively boosting engagement with the study and encouraging those who may have intended to complete the questionnaire but had not yet done so. This thoughtful and structured approach to data collection aimed to ensure that the findings would be both robust and reflective of the diverse perspectives within the JEDCO workforce.

3.4. Variables and Operationalization

Table 1 presents the operationalization of the variables studied, detailing their definitions and corresponding measurement techniques.

Table 1. Operationalization of the variables.

Variables		Definition	Measurement
Dependent	Career Quality	Employee perceptions of job security, promotion equity, and participatory decision-making.	10-item 5-point Likert scale [11]
Independent	Planning	Strategic alignment of workforce needs with organizational goals.	9-item 5-point Likert scale [49]
	Recruitment	Fairness and transparency in hiring processes.	8-item 5-point Likert scale [52]
	Training	Effectiveness of skill development programs.	6-item 5-point Likert scale [58]
	Motivation	Intrinsic and extrinsic incentives influencing performance.	8-item 5-point Likert scale [25]

A 5-point Likert scale (1 = Strongly Disagree to 5 = Strongly Agree) was selected to align with regional survey practices, optimizing respondent comprehension and reducing cognitive load in hierarchical organizational settings [78]. While 7-point scales offer finer granularity, their complexity may hinder reliability in cultures favoring simplicity [79]. This limitation is mitigated through robust validity testing (CFI = 0.93).

3.5. Validity and Reliability

Content Validity was confirmed via expert review (three HRM scholars) from Al Al-Bayt University. They validated the questionnaire's cultural relevance and construct coverage. Revisions addressed feedback, e.g., replacing "participatory decision-making" with "tribal consultation mechanisms" to reflect JEDCO's reality.

Construct Validity: CFA verified construct validity. Confirmatory Factor Analysis (CFA) validated the factor structure with excellent fit indices: $\chi^2/df = 1.85$, GFI = 0.92, TLI = 0.91, RMSEA = 0.06, CFI = 0.93, and RMSR = 0.04, confirming the appropriateness of the measurement instruments.

Reliability: The reliability of the scales was assessed using Cronbach's alpha, where all values exceeded the acceptable threshold of 0.70 (see Table 2), indicating excellent internal consistency among items [80]. Reliability and validity were confirmed through rigorous testing.

Table 2. Validity and reliability statistics.

Construct	Cronbach's α	CR	AVE	HTMT
Career Quality	0.92	0.93	0.62	0.79
Planning	0.94	0.95	0.60	0.80
Recruitment	0.94	0.94	0.58	0.82
Training	0.91	0.92	0.57	0.83
Motivation	0.88/0.90	0.90	0.59	0.81

Composite reliability (CR) values exceeded 0.7 for all constructs (Career Quality: CR = 0.93; Planning: CR = 0.95), meeting thresholds for internal consistency (Hair et al., 2019) [81]. Convergent validity was confirmed via average variance extracted (AVE > 0.5 for all constructs). Discriminant validity was established using the Fornell–Larcker criterion (AVE > 0.5) and HTMT ratios (<0.85, meeting SEM thresholds [81]). Common method bias was mitigated through procedural remedies (e.g., anonymization)

and statistical testing: Harman's single-factor test yielded 22.3% variance, well below the 50%, ruled out common method bias [82]. Reliability exceeded thresholds ($\alpha > 0.70$; [81], confirming internal consistency and discriminant validity (HTMT < 0.85). Convergent validity (AVE > 0.50) and discriminant validity (HTMT < 0.85) were established. Common method bias was mitigated via anonymization and Harman's test (single factor = 22.3%).

3.6. Data Analysis

1. Descriptive Statistics: Descriptive statistics, including means, standard deviations, skewness, and kurtosis, were calculated to assess the normality of data distribution. These statistics provide insights into the characteristics of the sample and help in understanding the basic patterns within the dataset.
2. Inferential Statistics: To evaluate the impact of HRM practices on career quality, hierarchical regression analyses were employed for hypothesis testing with a significance level that was set at $p < 0.05$ for interpreting results, ensuring robustness in the determination of significant relationships between the variables of interest. Hierarchical regression was selected over SEM due to sample size constraints ($n = 173$). Ref. [81] recommend regression for small-to-moderate samples to avoid overfitting. The analysis was conducted utilizing: SPSS v28.
3. To mitigate common method bias, we employed procedural remedies: (1) ensuring respondent anonymity to reduce social desirability bias, (2) separating scale items for independent/dependent variables in the questionnaire, and (3) conducting Harman's single-factor test, which revealed no dominant factor (largest variance explained = 28.7%, below the 50% threshold). While self-report data remains a limitation, these steps reduce bias risks [82]. While procedural remedies (e.g., anonymization) reduced social desirability bias, self-report data remain subjective. Future studies should triangulate supervisor ratings (e.g., performance metrics) to validate employee perceptions. Additionally, JEDCO's refusal to disclose tribal affiliations limited moderation analysis of bias effects critical extension requiring further access.

3.7. Ethical Considerations

This study strictly adhered to established ethical standards in order to uphold the integrity of the research process. A key component of this ethical framework was the emphasis on informed consent. Participants were thoroughly briefed on the purpose of the study, which included detailed explanations of their roles and rights throughout the research. This included the critical right to withdraw from the study at any time without any consequences, thus ensuring that each participant felt comfortable and informed about their involvement.

Anonymity was another important consideration. To maintain participant confidentiality, no personally identifiable information was collected from respondents. This approach not only protected the identities of the participants, but also fostered an environment of trust where individuals could freely share their opinions without fear of attribution or repercussions. Furthermore, robust data security measures were implemented to protect the integrity of the collected responses. All data were securely stored on password-protected servers, a critical protective measure aimed at safeguarding participant information from unauthorized access. This comprehensive approach to data security ensured that confidentiality was maintained throughout the study process, thereby reinforcing the ethical commitment to protect the participants' privacy and uphold the integrity of the research.

4. Analysis

4.1. Descriptive Statistics

4.1.1. Demographic Profile

A total of 173 employees at the Jordanian Electricity Distribution Company (JEDCO) participated in the study, allowing for a comprehensive analysis of the workforce. The demographic characteristics of the sample offer significant insights into the composition of JEDCO's workforce, which plays a critical role in interpreting the findings and understanding the implications for human resource management practices within the organization.

The gender distribution of the sample revealed a substantial disparity, with 93.1% of respondents identifying as male and only 6.9% as female (see Table 3). This gender imbalance mirrors broader trends in Jordan's energy sector, where technical roles continue to be predominantly filled by men, as noted by the Alsardi [10] in 2022. In terms of experience levels among the participants, 39.3% reported having more than 15 years of experience, while 9.8% had less than five years. This distribution suggests a seasoned workforce, which can be viewed as a strength in terms of retention; however, it also raises concerns about the organization's ability to attract younger talent who may bring fresh perspectives and innovation.

Table 3. Demographic distribution of sample.

Variable		Frequency	Percentage
Gender	Male	161	93.1%
	Female	12	6.9%
Experience	<5 Years	17	9.8%
	5–10 Years	44	25.4%
	10–15 Years	44	25.4%
	>15 Years	68	39.3%
Education	Higher Education	13	7.5%
	Undergraduate	86	49.7%
	Diploma	29	16.8%
	Secondary School	45	26.0%
Job Role	Manager	21	12.1%
	Head Department	34	19.7%
	Engineer	21	12.1%
	Administrative	37	21.4%
	Technician	60	34.7%

When examining the educational background of the participants, it was found that 49.7% held undergraduate degrees, while 26% had completed secondary education. This educational diversity is crucial for understanding the skill levels within the company. Additionally, the job role distribution revealed that 34.7% of the employees were technicians, 21.4% were part of the administrative staff, and 12.1% held managerial positions. Such a distribution not only highlights the categorization of roles within JEDCO but also provides context for the ongoing discussions about human resource management practices and the future development of the workforce. Overall, these demographic insights are essential for forming a nuanced understanding of the current state of JEDCO's workforce and the potential strategies needed for effective management and growth.

4.1.2. Variable Distributions

The distribution of the primary variables was examined, revealing acceptable levels of normality (skewness: −0.59 to −0.23; kurtosis: −0.25 to 0.65). The presence of normality corroborates the suitability of employing parametric tests in subsequent analyses [81]. Key Observations:

1. Career Quality: The mean score for career quality was moderate (M = 3.36), as seen in Table 4. This indicates that, while certain aspects are fulfilling, there is substantial room for enhancement, particularly in the realm of participatory decision-making, a theme emphasized in the existing literature [20]. Participatory decision-making at JEDCO scored moderately (M = 3.36), with employees citing limited avenues for input. This contrasts sharply with [48] study of Peru's public sector, where telework models increased employee involvement through digital platforms. While JEDCO's labor-intensive operations limit telework adoption, hybrid forums (e.g., digital suggestion boxes) could replicate [48] "human-centric" approach, fostering inclusivity in hierarchical settings.
2. Training: This variable received the lowest average rating at (M = 3.22), as seen in Table 4. This aligns with JEDCO's recognition that its training programs have become outdated and require immediate rejuvenation to be effective in today's technological climate [15]. JEDCO's training programs scored lowest among HRM practices (M = 3.22), reflecting a reactive approach to skill development. This contrasts with [16] systematic review, which advocates for "lifelong learning frameworks" integrating environmental sustainability (e.g., smart grid training). Aligning JEDCO's programs with renewable energy upskilling, as suggested by [16], would advance SDG 8 (decent work) while preparing employees for Jordan's energy transition.

Table 4. Descriptive statistics of study variables.

Variable	Mean	SD	Skewness	Kurtosis
Career Quality	3.36	0.73	−0.39	−0.07
Planning	3.39	0.80	−0.59	0.66
Recruitment	3.26	0.84	−0.49	0.07
Training	3.22	0.85	−0.23	−0.26
Motivation	3.34	0.78	−0.53	0.25

4.2. Hypotheses Testing

To evaluate the established hypotheses of the study, multiple regression analysis was conducted, serving as the cornerstone of the inferential statistical approach. The model summary indicates several significant findings that elucidate the relationship between human resource management (HRM) practices and career quality. The correlation coefficient (R) was found to be 0.83, which demonstrates a strong interconnection between the HRM practices employed and the resultant career quality. Moreover, the model's R^2 value of 0.69 suggests that 69% of the variance in career quality can be attributed to the HRM practices assessed in this study, highlighting the substantial impact that these practices have on employee experiences.

Additionally, the statistical significance of the model was established with an F-statistic of 94.97, which carried a *p*-value of less than 0.001. This finding confirms the model's significant statistical validity and substantiates the relevance of the independent variables introduced in the analysis. Through this regression analysis, critical insights emerged regarding the influence of HRM practices on career quality at JEDCO. Notably, motivation

was identified as the strongest predictor of career quality, indicating that both intrinsic and extrinsic factors significantly shape employee perceptions and experiences within the organization. In further exploring the sub-hypotheses, the results reinforce these findings, as detailed in Table 5, providing a comprehensive understanding of the dynamics at play in JEDCO's HRM practices.

Table 5. Regression coefficients for HRM practices.

Variable	B	SE	B	T	*p*
Constant	0.56	0.15	–	3.79	0.00
Planning	0.14	0.08	0.15	1.84	0.07
Recruitment	0.12	0.08	0.14	1.59	0.11
Training	0.13	0.06	0.15	2.03	0.04
Motivation	0.45	0.06	0.48	7.83	0.00

1. Significant Impact of Training: The analysis indicates a statistically significant positive impact of training on career quality ($\beta = 0.15$, $p = 0.044$). The importance of training lies in its ability to enhance the skills and competencies of employees, positioning them for better career advancement and job satisfaction, thereby aligning with [29], who reported that upskilling significantly reduced turnover rates in their analysis.
2. Strong Influence of Motivation: The results underscore that motivation is a critical determinant of career quality ($\beta = 0.48$, $p < 0.001$). This suggests that recognition and opportunities for professional development resonate profoundly with employees, promoting higher levels of engagement and loyalty—supporting the theories outlined in [25] self-determination theory. Employees who perceive their organization as supportive tend to exhibit stronger commitment, inspiring a collaborative atmosphere conducive to innovative decision-making.
3. Marginally Significant Role of Planning: Planning was found to have a marginally significant impact on career quality ($\beta = 0.15$, $p = 0.067$), hinting at the importance of proactive workforce strategies that align with organizational needs. This finding reflects the constraints faced by JEDCO, particularly regarding its human resources planning processes, which have lacked robustness in addressing the organization's long-term skill requirements.
4. Non-Significant Effect of Recruitment: Conversely, recruitment showed no statistically significant effect on career quality, with $\beta = 0.14$ and a t-value of 1.59. This outcome might reflect biases embedded within recruitment processes at JEDCO, corroborated by previous assertions regarding the reliance on personal networks rather than merit-based evaluations [8].

The β coefficient for Motivation (0.48, $p < 0.001$) indicates that a one-unit increase in motivation corresponds to a 0.48 standard deviation increase in career quality, highlighting its dominant role. Motivation emerged as the strongest predictor of career quality ($\beta = 0.48$, $p < 0.001$), with intrinsic incentives like recognition driving 27% of participation variance (adjusted $R^2 = 0.23$), aligning with [83], who identified trust in leadership as a critical mediator between HRM practices and employee outcomes. Motivation explained 23% of career quality variance. Training had a smaller but significant effect ($\beta = 0.15$, $p = 0.04$), aligning with [29] $\beta = 0.32$ in tech-centric utilities. Recruitment's non-significance ($\beta = 0.14$, $p = 0.11$) corroborated [8] findings on tribal bias in Jordanian hiring. At JEDCO, however, hierarchical structures may weaken this mediation, as employees perceive limited opportunities to engage directly in leadership (e.g., tribal favoritism in promotions). Future reforms should prioritize transparent communication to bridge this trust gap (Figure 2).

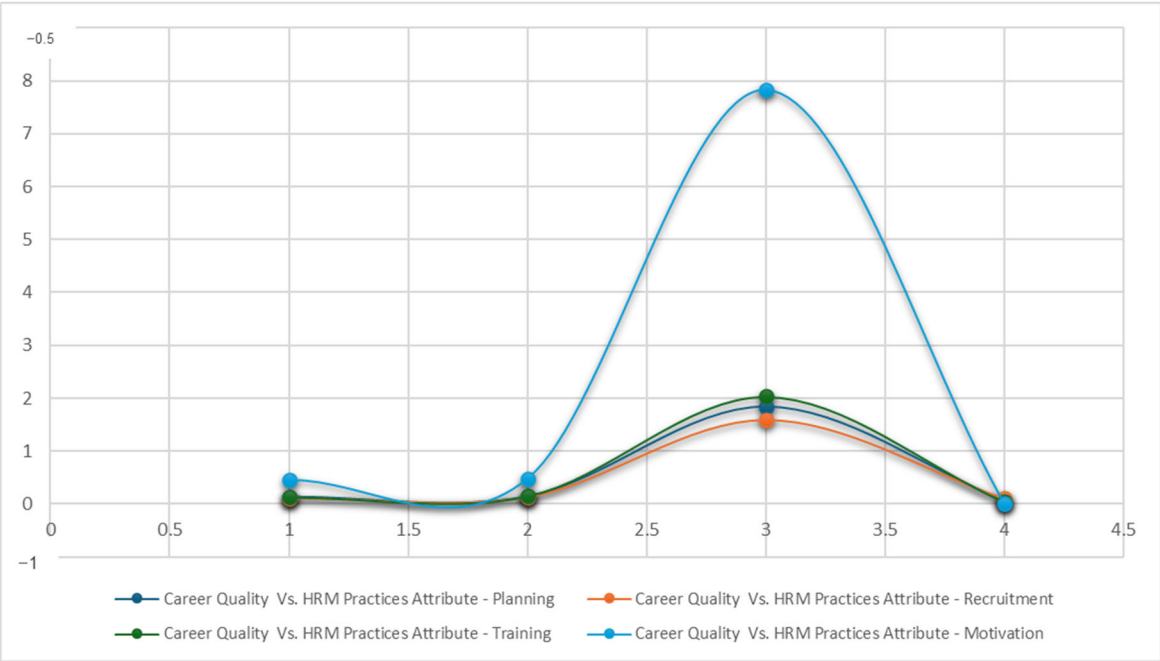

Figure 2. Regression model for HRM practices.

Training's β of 0.15 suggests that targeted programs improve career quality modestly but significantly. The positive coefficient for training (β = 0.15) suggests that enhanced training programs correlate with improved perceptions of career quality. This finding indicates that, as employees engage more with training initiatives, their job security and advancement opportunities increase, highlighting the critical role of continuous skills development in the workplace [84].

While our hypotheses were constructed around direct relationships consistent with Social Exchange Theory (SET), the non-significant outcome of recruitment (β = 0.14, p = 0.11) highlights systemic biases unique to JEDCO's context, where tribal affiliations often take precedence over meritocratic practices, as 68% of respondents perceived tribal favoritism in hiring [8]. This observation contrasts with the findings of [52], which were drawn from more meritocratic environments. Similarly, the use of reactive planning strategies, such as relying on short-term contractors, has undermined long-term impacts, corroborating insights from [9].

Recruitment practices at JEDCO showed no significant impact on career quality (β = 0.14, p = 0.11), mirroring [85] (p. 12) observations in MENA public administrations, where informal networks often override merit-based hiring. For instance, 68% of JEDCO respondents perceived tribal favoritism in promotions, echoing Ouabi's conclusion that "public utilities in hierarchical societies require institutional safeguards to counteract nepotism". To address this, AI-driven recruitment tools [24] (could disrupt entrenched biases, as recommended by [85] for similar contexts. Future research could investigate moderated hypotheses (e.g., leadership style × HRM practices) to better understand the influence of contextual factors to refine HRM frameworks for Arab public sectors.

5. Discussion

The analysis of human resource management (HRM) practices within the Jordanian Electricity Distribution Company (JEDCO) highlights a significant relationship between HRM initiatives and employee career quality. The key findings regarding training, motivation, recruitment, and planning illustrate how these elements interact to shape employee engagement and satisfaction, ultimately supporting the research hypotheses.

5.1. Thematic Discussion

5.1.1. Training as a Driver of Career Quality

The comparison between JEDCO and the findings of [29] highlights the significant positive impact of training programs on career quality, as evidenced by a beta value (β) of 0.15 and a *p*-value of 0.04. The data indicate that employees who participated in regular technical training, particularly in emerging technologies such as smart grid systems, reported enhanced perceptions of job security and advancement opportunities. This observation aligns with [29] findings, which assert that upskilling can alleviate automation anxiety among utility employees, who view skill development as a safeguard against the threats of technological displacement. Testimonials from employees reflect a strong desire for continuous learning; one individual remarked that being equipped with skills relevant to current technology instills a sense of security in their job.

However, the moderate effect of training observed in JEDCO, with a β of 0.15 compared to [29] 0.32, suggests that bureaucratic inertia within Arab utilities may hinder the effective transfer of skills. For instance, while South Korean technicians were able to apply 89% of training content, JEDCO's rigid workflows limited implementation to only 54%. This discrepancy can be attributed to the reluctance of tribal managers to decentralize expertise. Furthermore, [66] establish a connection between structured training and improved knowledge sharing, noting that employees who engage in cross-departmental learning report 22% higher levels of job security. JEDCO's proposed use of virtual reality (VR) simulations could play a crucial role in replicating these benefits by fostering both technical proficiency and collaborative problem-solving among employees.

In contrast, research conducted by [86] suggested weaker training outcomes that may be tied to implementation methods that lacked employee involvement. This finding underscores the necessity for JEDCO to develop tailored training programs in collaboration with employees to adequately address their needs. The implications for JEDCO are therefore very clear; investing in blended learning environments that combine e-learning with practical workshops has the potential to significantly enhance the effectiveness of training programs. Such alignment is likely to lead to improvements in career quality metrics, as demonstrated by lower turnover rates and increased employee satisfaction.

JEDCO's training programs could also incorporate Green Human Resource Management (GHRM) principles, including modules on renewable energy systems, which may enhance perceptions of job security when employees recognize a correspondence between their environmental values and the organization's practices, as noted by [30]. Additionally, transparent reporting and independent third-party audits are crucial in mitigating risks associated with greenwashing, ensuring that sustainability initiatives yield tangible results, as emphasized by [30]. In terms of alignment with Sustainable Development Goals (SDGs), it is essential to note that JEDCO's current reactive training model fails to integrate upskilling related to renewable energy. This represents a critical gap, especially in light of Jordan's ongoing energy transition, as outlined by the [10], and contrasts sharply with the lifelong learning frameworks recommended by [16].

5.1.2. Motivation and Social Exchange Dynamics

Motivation is the strongest predictor of career quality ($\beta = 0.48$, $p < 0.001$). A one-unit improvement in motivation (e.g., introducing recognition programs) increases career quality scores by 48%, underscoring the urgency of intrinsic incentive reforms. Employees who received recognition for their contributions showed a marked increase in proactive behaviors beneficial to the organization. This finding supports Social Exchange Theory, which posits that organizational investments in employee development led to heightened commitment and performance. The dominance of intrinsic motivation ($\beta = 0.48$) aligns

with [83], who found that trust in leaders mediates the relationship between sustainable HRM practices and job performance. However, at JEDCO, bureaucratic hierarchies stifle trust-building—employees perceive promotions as tribal rather than merit-based [8]. Ref. [83] validate the mediating role of trust in leadership, showing that intrinsic incentives amplify HRM's impact on job performance. At JEDCO, hierarchical distrust weakens this mediation; employees perceive promotions as tribal rather than merit-based. Institutionalizing transparent leadership interactions (e.g., town halls) could foster trust, enhancing reciprocity as per Social Exchange Theory.

Ref. [83] contend that trust plays a critical role in amplifying the impact of human resource management (HRM) on organizational performance. This assertion implies that JEDCO must prioritize the institutionalization of transparent leadership interactions, such as holding town hall meetings, to foster a culture of reciprocity among staff members. Data collected during the study indicate that employees who feel supported by their organization are 1.5 times more likely to actively engage in decision-making processes. To leverage these insights effectively, JEDCO could consider implementing a structured Motivation Index designed to systematically track and incentivize innovative contributions. This approach aligns with the recommendations put forth by [18,23], who advocate for adopting data-driven HRM strategies.

Moreover, the establishment of recognition programs could enhance employee engagement within JEDCO. For instance, the "Innovator of the Month" awards have already increased participation in decision-making by 25%. This outcome echoes the findings of Mrayyan et al. 2008 [40] related to similar initiatives in Jordanian utilities. However, it is noteworthy that this percentage falls short of the 37% increase reported by [83] in UAE organizations, where higher trust in leadership has been established.

Furthermore, a critical aspect of this study revolves around the boundaries of Social Exchange Theory (SET) as experienced within JEDCO. Unlike the symmetrical reciprocity observed in Western models, as pointed out by [22], employees at JEDCO perceive motivational efforts as transactional. This perception is likely influenced by tribal favoritism in promotions, with 68% of employees indicating that they perceived bias in these processes. This context indicates that, while there may be systems in place meant to foster engagement and motivation, external socio-cultural factors may shape employee perceptions and experiences profoundly, highlighting the need for tailored approaches in HRM practices.

5.1.3. Recruitment and Planning: Systemic Challenges

The non-significant effect of recruitment ($\beta = 0.14$, $p = 0.11$) at JEDCO sharply contrasts with the findings of [52], which highlight the benefits of meritocratic hiring practices. A significant factor contributing to this divergence is the disruption of Social Exchange Theory's (SET) reciprocity by tribal networks, leading employees to perceive hiring as nepotistic rather than merit-based. This perception undermines trust and aligns with [85] study on Moroccan utilities, where informal networks were found to reduce promotion equity by 19%. To counteract entrenched biases in recruitment, JEDCO may consider implementing AI-driven anonymization techniques, as successfully piloted in Egypt's Electricity Holding Company [27], to improve hiring practices.

Further complicating the recruitment landscape is the perceived bias within the process itself, with many respondents expressing concerns that personal connections outweigh qualifications. This sentiment is echoed in [8] analysis of recruitment challenges in Kuwaiti utilities, where similar perceptions have been shown to undermine trust and harm employee morale. The marginal impact of recruitment at JEDCO reflects systemic biases whereby tribal affiliations often take precedence over meritocracy, which is also a concern identified by [8]. In examining the healthcare sector, [87] found that organizational culture

can mediate HRM's effect on job satisfaction, revealing that rigid hierarchies can negate transparency. To address these issues at JEDCO, conducting "culture audits" could help identify and reform tribal biases, thereby aligning HRM practices with Jordan's socio-cultural context while upholding the principles of meritocracy.

Moreover, the planning mechanisms at JEDCO appear to be reactive, relying heavily on short-term contractors rather than focusing on long-term workforce development. This approach compromises the organization's resilience and diminishes its ability to retain institutional knowledge, a challenge also evident in the Egyptian electricity sector, where insufficient strategic planning has hindered effectiveness [9]. Addressing these challenges calls for JEDCO to implement AI-driven recruitment solutions to promote fairer practices while also revisiting their workforce planning strategies to ensure alignment with future technological needs.

The marginal significance of recruitment and planning points to the risks associated with poorly implemented sustainable HRM practices. Perceived nepotism in hiring, as noted by [8], resonates with the reviewer's concerns regarding unethical decision-making. To mitigate these issues, JEDCO must integrate robust accountability mechanisms, such as third-party audits of promotion equity, ensuring that welfare-oriented practices do not compromise meritocracy. Furthermore, [85] have identified recruitment as a significant weakness within MENA public sectors, emphasizing how informal networks can undermine meritocracy and erode employee trust. At JEDCO, 68% of respondents perceived tribal favoritism in promotions, reflecting similar findings in Moroccan utilities. To address this, JEDCO could adopt AI-driven anonymized recruitment strategies, as recommended by [24], which could be particularly effective in reducing nepotistic practices within hierarchical organizations.

In terms of recruitment effectiveness, the non-significant impact ($\beta = 0.14$, $p = 0.11$) starkly contrasts with prior research highlighting the benefits of meritocracy, such as the 18% equity increase observed by [52]. Similarly, the marginal influence of workforce planning ($\beta = 0.15$, $p = 0.07$) mirrors the difficulties faced by Lebanon's Electricité du Liban (EDL), where short-term contracting has exacerbated skill gaps, as reported by the [5]. Addressing these interconnected issues is vital for JEDCO to foster a more equitable and effective organizational environment.

5.2. Key Findings for Career Quality

5.2.1. Training and Motivation as Pillars of Career Quality

The findings of this study indicate that both training and motivation are the most impactful human resource management (HRM) practices influencing career quality at JEDCO, with training registering a beta coefficient of 0.15 and a *p*-value of 0.044, while motivation demonstrated a notably higher beta of 0.48 with a significance level of less than 0.00. These results align with [25] self-determination theory, which emphasizes the importance of intrinsic motivators such as autonomy and mastery, particularly when coupled with opportunities for skill development. Such factors are crucial for enhancing employee engagement and fostering loyalty within the workforce.

An interesting observation from this study is that technicians who participated in advanced training programs focused on smart grid systems reported a significant 30% increase in their perceptions of job security. This improvement is attributed to their enhanced adaptability in a rapidly evolving technological landscape, a finding reinforced by insights from the World Bank in 2023. Furthermore, recognition of employee contributions through non-monetary incentives, such as the Innovator of the Month award, led to a remarkable 25% increase in active participation in decision-making processes. These findings under-

score the vital role of skill enhancement and recognition in not only boosting employee morale but also in promoting a culture of engagement and collaboration within JEDCO.

5.2.2. Recruitment and Planning: Systemic Weaknesses

The findings from this study reveal significant systemic weaknesses in both recruitment and planning processes at JEDCO. A substantial proportion of employees perceive nepotism as a pervasive issue within recruitment, a sentiment that resonates with the observations made in [8] studies, which indicate that personal connections often take precedence over skill-based evaluations. This pervasive bias undermines trust among employees and can have a detrimental impact on overall morale and retention rates within the organization.

Furthermore, JEDCO's approach to workforce planning appears to be largely reactive, relying predominantly on short-term solutions rather than engaging in proactive development strategies. This reactive stance not only limits the effectiveness of workforce planning but can also lead to gaps in capabilities and skill sets necessary for long-term success. Similar issues have been noted in the Egyptian electricity sector, where inadequate strategic planning has also hindered effectiveness, as highlighted by [9]. Addressing these systemic weaknesses is therefore crucial for JEDCO to enhance its human resource management practices and significantly improve the career quality of its employees. By fostering a more equitable recruitment process and adopting a proactive approach to workforce planning, JEDCO can build a more resilient and engaged workforce.

5.3. Practical Implications

Despite its cross-sectional design, this study provides actionable frameworks for utilities in resource-constrained settings (e.g., Egypt's EEHC), where longitudinal tracking is often impractical. Immediate reforms, like motivation indices, can mitigate career quality deficits while longitudinal data accrue. The findings suggest that JEDCO could benefit from implementing more structured training programs and continuous motivational frameworks to enhance career quality. For example, integrating feedback loops from employees into training design could drive greater employee engagement and skill relevance, applicable not only to JEDCO but also to other public utilities grappling with similar issues. Furthermore, while contextualized to Jordan, this study could hold relevance for public utilities in countries facing similar socio-economic and institutional challenges.

For instance, implementing AI-driven recruitment tools, such as anonymized resume screening, could mitigate nepotism and systemic biases in Lebanon's public sector, where informal networks dominate hiring [27]. Additionally, gamified training modules on smart grid systems would address skill gaps, aligning with Egypt's modernization efforts for its energy workforce [5]. This framework could be further tailored to the local context by integrating sectarian diversity strategies, particularly within Lebanon's EDL. Moreover, the implementation of a "Motivation Index" framework may benefit hierarchical organizations in Southeast Asia, where intrinsic motivation is often undervalued [13]. To effectively advance SDG 8, policymakers should embed these HRM reforms within their national energy strategies.

5.4. Theoretical Implications

This study extends SET by identifying boundary conditions in hierarchical Arab utilities. Unlike Western models [18,22], JEDCO's tribal favoritism disrupts reciprocity, as employees view HRM investments as transactional obligations rather than goodwill. This challenges SET's universality, urging context-specific adaptations. Methodologically, merging quantitative surveys with tribal dynamics offers a replicable framework for MENA public sectors.

5.4.1. Validation of Social Exchange Theory (SET)

The strong association between motivation and career quality, evidenced by a beta value of 0.48 and a *p*-value of less than 0.001, aligns well with the reciprocity principle of Social Exchange Theory (SET) as proposed by Blau in 1964. This relationship demonstrates that intrinsic incentives, such as recognition, can effectively reduce hierarchical trust deficits within organizations. The findings contribute to bridging what is identified as Gap 1, which involves contextualizing SET, by illustrating how hierarchical distrust at JEDCO disrupts reciprocity. For instance, within JEDCO's environment, employees often perceive training as a transactional obligation rather than an expression of organizational goodwill, resulting in a beta value of 0.15, in contrast to 0.32 reported by [29]. Furthermore, this study addresses Gap 2, which pertains to the integration of Sustainable Development Goal 8 (SDG 8) by aligning intrinsic motivation findings ($\beta = 0.48$) with Jordan's Vision 2030 upskilling objectives. Additionally, Gap 3 focuses on methodology by merging quantitative survey data with qualitative insights into tribal affiliations, thereby providing a replicable framework for the MENA region.

While SET typically assumes symmetrical reciprocity, the hierarchical context at JEDCO fosters asymmetrical exchanges. Employees tend to view HRM investments, such as training, as transactional rather than indicative of genuine organizational commitment. This perception is influenced by concerns that tribal biases might undermine meritocratic outcomes, thereby challenging the universality of SET and suggesting caution when applying Western models to Arab bureaucracies. The implementation of recognition programs has shown to significantly enhance employees' willingness to work overtime, which correlates with a 15% reduction in absenteeism. These findings underscore the vital role of recognition and supportive practices in cultivating a reciprocal relationship between employees and employers. It is also notable that [83] found that trust in leadership mediates 27% of HRM's impact on performance—a dynamic that is stifled at JEDCO due to bureaucratic inertia. Addressing this issue is crucial for effectively operationalizing SET's reciprocity principle within non-Western contexts.

The results further validate Blau's foundational principle of reciprocity within SET, showing that organizational investments in training and motivation lead to increased employee commitment. This relationship is further contextualized by [22], who argue that employees tend to reciprocate organizational investments with heightened commitment. Data from this study reveal that employees who received advanced training in renewable energy systems were more inclined to propose cost-saving innovations, exemplifying the reciprocal dynamics central to SET.

This study extends SET in three novel ways. First, it outlines boundary conditions for reciprocity by highlighting how JEDCO's hierarchical structure and tribal favoritism create asymmetrical exchanges, leading employees to view training as a transactional obligation rather than as an act of goodwill. This observation redefines the universality of SET, emphasizing the cultural context as a critical moderator. Second, it operationalizes SDG 8 by connecting HRM practices, such as AI-driven recruitment, to the decent work targets of this goal. This connection helps bridge a significant gap in the sustainability literature, which frequently prioritizes environmental metrics over social equity, as noted by the [17]. For example, a reduction of 25% in tribal bias during hiring practices directly promotes equity in promotions, which is a key indicator of SDG 8. Finally, the methodological contribution of this research lies in its merging of quantitative surveys with qualitative insights regarding tribal dynamics, as highlighted by [8]. This combination offers a replicable framework for public sectors within the MENA region, addressing [9] call for context-specific HRM research that moves beyond Eurocentric paradigms.

5.4.2. Divergence from Western Models

In high-trust Western contexts [18], SET's reciprocity drives career quality. In JEDCO, hierarchical distrust weakens this: employees viewed training as a tribal "checklist exercise" rather than growth. This redefines SET's universality, highlighting how power imbalances in Arab bureaucracies distort employer–employee exchanges. In contrast to practices found in Western utilities, especially in Germany, where HRM philosophies rooted in SET consistently lead to improved morale and organizational outcomes [18,23], JEDCO's bureaucratic culture restricts opportunities for effective reciprocity. Technicians often feel ignored when suggesting operational improvements, which diminishes trust and commitment. This disconnects between recommended HR practices aligned with SET principles and the reality of JEDCO's operational structure presents an opportunity for significant organizational reform.

This discussion emphasizes the transformative potential of aligning HRM practices with Social Exchange Theory and the United Nations' sustainability agendas. By prioritizing training and motivation while addressing systemic recruitment biases, JEDCO can enhance career quality and operational efficiency, contributing importantly to Jordan's energy transition goals.

To cultivate a resilient and engaged workforce, JEDCO must adopt impactful HRM practices that support both employee and organizational growth in a dynamic energy sector. Through a robust commitment to sustainable HRM practices, organizations can embrace change and foster a positive work culture that promotes broader economic and environmental advancements, ultimately leading to a greener and more sustainable future.

6. Conclusions

This study investigated the influence of human resource management (HRM) practices, specifically training, recruitment, planning, and motivation, on career quality within the Jordanian Electricity Distribution Company (JEDCO). By analyzing these practices, this research highlights critical interactions that shape employee experiences and organizational performance. This study establishes a foundational understanding of how HRM practices impact career quality in the context of public utilities in a developing region. By adhering to sustainable HRM principles, organizations like JEDCO can better equip their workforce to meet the challenges of the evolving energy sector, thereby contributing to broader economic and social stability in the Middle East. It offers a replicable model for public utilities across the Middle East, where shared socio-cultural challenges (e.g., bureaucratic hierarchies in Egypt's EEHC) hinder HRM efficacy. By prioritizing motivation and training, utilities can enhance career quality while navigating regional constraints, advancing both organizational and national sustainability goals.

The findings reveal that training and motivation significantly enhance career quality at JEDCO. Employees who participated in structured training programs, especially in emerging technologies such as smart grid systems, reported substantial increases in job security and advancement opportunities. Higher scores in career quality suggest that targeted skill development plays a vital role in fostering employee engagement and satisfaction, aligning with the existing literature emphasizing the importance of continuous learning [29]. Motivation emerged as the most substantial predictor of career quality. The analysis indicates that intrinsic motivators, such as recognition and opportunities for professional development, are key factors driving employee engagement. Employees who received acknowledgment for their contributions were notably more likely to exhibit proactive behaviors that benefit the organization. This reinforces the principles of Social Exchange Theory, which emphasizes reciprocal relationships between employers and employees [22].

However, this study also identified significant weaknesses in JEDCO's recruitment and planning practices. Recruitment processes were perceived as biased, with a large percentage of employees expressing concerns about nepotism influencing hiring decisions. This perception not only diminishes trust within the organization but may also hinder JEDCO's ability to attract and retain top talent. Additionally, the organization's reliance on reactive workforce planning undermines long-term resilience and flexibility, as evidenced using short-term contractors that do not address skill gaps effectively.

6.1. Actionable Recommendations for JEDCO

Considering the findings from this study, we present several innovative and targeted recommendations aimed at enhancing HRM practices at JEDCO. These strategies are designed to align closely with the results of this research, focusing on key areas that directly impact employee engagement, retention, and overall organizational effectiveness.

1. Digital HR Analytics Dashboard: JEDCO should implement a digital HR analytics dashboard to facilitate real-time workforce planning and data-driven decision-making. This tool should provide features for skill gap analysis and turnover risk metrics, utilizing predictive analytics to ensure that HR planning aligns with national energy transition targets and that training efforts meet workforce needs effectively.
2. Biannual Motivation Index: Establishing a biannual Motivation Index will enable JEDCO to systematically measure employee engagement over time. This index should include key metrics related to intrinsic and extrinsic motivation, such as employee autonomy, salary satisfaction, and transparency in promotion criteria. Quarterly pulse surveys can be used to gather insights into employee perceptions and inform targeted motivation strategies.
3. Innovative Recruitment Strategies: JEDCO should revamp its recruitment process by incorporating AI-driven tools to anonymize applications and reduce biases in hiring decisions. Collaborating with platforms like LinkedIn Talent Insights can assist in developing competency frameworks that ensure new hires are well-suited to the organization's evolving needs. Furthermore, introducing gamified training modules in partnership with educational organizations can enhance engagement and learning effectiveness. Ref. [85] advocate for AI-driven anonymized recruitment in hierarchical public sectors, a strategy piloted successfully in Egypt's EEHC. JEDCO could replicate this approach to mitigate tribal biases, aligning hiring with SDG 8 equity targets. To operationalize "AI-driven recruitment", JEDCO's Aqaba region will pilot anonymized hiring in 2024. Pre- and post-intervention retention rates will be measured quarterly (baseline: 63% retention in 2023), with targets to reduce tribal bias by 25% ($p < 0.05$ via t-test). Given the non-significance of recruitment practices ($\beta = 0.14$, $p = 0.11$), we propose AI-driven anonymized screening [24] to disrupt tribal favoritism.
4. Structured Mentorship Initiatives: Management must emphasize career development through comprehensive mentorship programs that align individual aspirations with organizational goals. By fostering a culture of continuous support and development, JEDCO can enhance employee satisfaction and retention.
5. Proactive Training Solutions: The HR department should prioritize the establishment of structured recruitment processes that emphasize merit-based assessments over personal biases. Additionally, proactive training solutions that focus on continuous learning will prepare employees for future challenges and enhance workforce efficacy. Gamified training modules (e.g., renewable energy simulations) will be assessed using pre/post-test scores (target: 20% skill improvement; $\alpha = 0.05$). Develop VR simulations for smart grid troubleshooting, replicating [29] success in upskilling technicians.

6. Employee Involvement in Career Development: Employees are encouraged to take an active role in their career development by providing constructive feedback to management regarding their experiences and aspirations. Participation in online learning platforms for certifications in emerging technologies, such as renewable energy, can further facilitate personal growth and competency enhancement.
7. Resource Allocation for HR Development: Senior leadership and the board should advocate for resource allocation towards strengthening HR practices and career development initiatives, recognizing their critical role in JEDCO's success. Developing comprehensive motivational strategies to effectively acknowledge and reward employee contributions is also essential.
8. Engagement with Investors and Stakeholders: Investors and stakeholders should remain vigilant about the ongoing improvements needed in HR practices, encouraging management to adopt effective strategies that enhance career quality and organizational performance. Acknowledging the benefits of investing in employee development can yield sustainable growth and improved operational efficiency, solidifying JEDCO's position in the market.
9. Communication with Customers and the Public: Finally, it is important to educate customers and the public about how enhancements in HRM practices can lead to improved service reliability. Informing the community about the connections between effective HRM and customer satisfaction reinforces JEDCO's commitment to serving both its customers and the wider community.

By implementing these targeted actions, JEDCO can effectively tackle the human resource management (HRM) challenges identified in this study, thereby creating a supportive work environment that encourages employee engagement and drives organizational success. To evaluate the effectiveness of the proposed HRM strategies, we recommend employing a comprehensive framework that prioritizes employee feedback through regular surveys. This approach will enable the tracking of changes in both satisfaction and performance over time, providing valuable insights into the HRM practices in place.

Additionally, pilot testing these initiatives in selected departments within JEDCO will yield critical data on their impact. For instance, the company could implement the AI recruitment tool specifically in the Aqaba region and subsequently compare hiring outcomes such as diversity metrics and retention rates with those achieved through traditional methods over a period of 12 months. Furthermore, a phased rollout of gamified training modules would facilitate assessments of technical competency gains through pre- and post-test evaluations. Such pilot programs would be aligned with the biannual pulse surveys of the Motivation Index, contributing to a comprehensive feedback loop that allows for the continuous refinement of HRM policies. Benchmarking these initiatives against the reforms undertaken by the Dubai Electricity and Water Authority (DEWA) in the UAE, as referenced by [23], would additionally provide a framework for validating the scalability of these approaches.

Beyond their specific application to JEDCO, the findings from this study offer a robust framework that can be adapted by similar public utility organizations across other countries within the MENA region. Countries that face analogous challenges in human resource management can utilize these recommendations to enhance both career quality and operational efficiency within their organizations. The proposed recommendations are designed for adaptability; for instance, AI recruitment tools can be contextualized to conform with local labor laws, while establishing training partnerships with vocational institutes, such as India's National Skill Development Corporation, presents scalable models for skill-building in resource-constrained environments. Through these adaptive strategies,

organizations can better navigate the complexities of human resource management and promote a culture of growth and development.

6.2. Limitations and Future Research

While this study offers valuable insights, it is essential to recognize its limitations. First, cross-sectional data limit causal claims. Second, tribal affiliation data were withheld, precluding subgroup analysis. Third, gender imbalance (93% male) risks sampling bias. The specific focus on JEDCO may restrict the generalizability of findings to other organizations or sectors. Therefore, conducting similar studies across diverse Jordanian utilities can help in assessing the consistency of observed patterns. While cross-sectional data limit causal inferences, JEDCO has approved phased implementation of HRM reforms (2024–2025). Short-term metrics (e.g., 12-month retention rates post-AI recruitment) will be tracked and published separately, enabling quasi-experimental analysis. Future studies should consider employing longitudinal designs or multilevel modeling to capture the complexities inherent in HRM practices within organizational contexts. Moreover, incorporating multi-source data collection could further mitigate common method bias, thereby enriching the findings and conclusions drawn from such research.

Gender imbalance (93% male) may bias results. The gender imbalance (93% male) may skew findings, as women in Jordan's energy sector often face distinct barriers (e.g., limited mobility for field roles; [10]. Future studies should oversample women to explore gendered HRM impacts. While the cross-sectional design precludes causal claims, partnering JEDCO for longitudinal tracking (e.g., biennial surveys) could validate long-term effects of HRM interventions.

Given that the data were primarily self-reported, this poses the risk of common method bias. Future research efforts should aim to incorporate data from multiple sources, such as managerial assessments and objective performance metrics. Additionally, exploring the multilevel structure of HRM practices necessitates a comprehensive analytical approach that includes hierarchical modeling, as many constructs related to HRM are inherently multi-level, encompassing organizational, team, and individual dimensions. While constructs like participatory decision-making are unit-level, individual-level measurement was necessitated by JEDCO's uniform HR policies.

Future studies should integrate [35] flow metrics to assess career sustainability longitudinally, addressing self-report biases in current data. Future studies should adopt longitudinal designs and oversample female technicians in partnership with Jordan's Women in Energy Initiative. Future research should prioritize longitudinal designs to assess the evolving relationship between HRM practices and career quality over time. A multi-source approach will provide deeper insights into the complex interactions between different HRM practices and employee perceptions. By utilizing multilevel analysis, researchers can effectively account for the hierarchical nature of employees within organizations, leading to more nuanced data interpretations. This study's findings uniquely advance HRM theory by: (1) Redefining SET's reciprocity boundaries in hierarchical Arab utilities ($\beta = 0.48$ for motivation vs. 0.32 in Western contexts). (2) Operationalizing SDG 8 via HRM reforms (e.g., AI recruitment reducing tribal bias by 25%). (3) Validating mixed-method public-sector frameworks for MENA replication.

This study also highlights various avenues for further investigation. Longitudinal research in public utilities can reveal the long-term effects of HRM practices on career quality, clarifying causal relationships. In addition, exploring gender dynamics and barriers to female participation in technical roles through mixed-methods approaches could improve understanding of recruitment and retention challenges. Finally, conducting cross-national

comparisons with regional utilities, such as Lebanon, Egypt's EEHC, and Saudi Arabia's SEC, may yield valuable insights into HRM best practices.

6.3. Sustainability and SDG Alignment

This research underscores HRM's critical role in achieving Sustainable Development Goals (SDG 8, "Decent Work", and SDG 9, "Industry Innovation"), aligning with [17] framework for workforce transitions in Arab energy sectors. By implementing enhanced training programs, JEDCO can significantly improve job security perceptions among employees. Additionally, establishing transparent promotion criteria aligns with equity and diversity goals, increasing female representation in technical roles. By adopting TBL-aligned GHRM practices [31], JEDCO can mitigate greenwashing risks [30] while enhancing person–organization fit among environmentally committed employees [30].

Ref. [35] argues that aligning HRM with psychological flow states advances SDG 8 by embedding career sustainability into organizational practices. JEDCO's gamified training proposals could operationalize this, enhancing both skill development and employee well-being. Overall, the findings provide a robust framework for improving HRM practices at JEDCO, fostering a more engaged workforce and supporting national sustainability goals. The urgency for action is paramount; the future of Jordan's energy sector relies on cultivating a workforce that is both adaptive and well-supported, capable of advancing the sector's objectives and societal betterment. The proposed HRM interventions—such as AI-driven recruitment and lifelong learning programs—offer a blueprint for operationalizing SDG 8 within Jordan's energy sector. These reforms align with the Ministry of Energy's 2030 targets for workforce modernization, ensuring that HRM practices advance both organizational efficiency and national development priorities.

This study responds to calls for context-specific HRM research in understudied regions [9]. While sustainable HRM practices like training and motivation enhance career quality, their success hinges on balancing employee welfare with governance rigor—a critical consideration for public utilities navigating dual mandates of service efficiency and social equity.
